

Concentric Security Systems Integration

Protection of a facility is not dictated by the force protection rating of the barrier in the roadway; but rather by a functional, fully integrated security system that meets the required design threat. Today's security solutions require integration of multiple security construction disciplines including perimeter protection, access control, traffic control, safety and emergency response.

Concentric Security's expert design team works with the customer from the inception of the security design to help define and develop a theory of operation which incorporates traffic flow requirements, threat design, product selection, and interface with various systems including card access system, fire alarm systems, emergency response requirements, UL safety and requirements. Concentric Security integrates security products supplied by most nationally recognized manufacturers into an overall security solution and Concentric Security's technicians are trained and certified in installation and service for those products.

Concentric Security Systems Integration

Concentric Security's Integrated Control Systems interface with hardware and software to include:

- Customizable System Configuration
- Ease of Use Touchscreen, Graphic Layout or Push Button Stations
- Adaptable to Site Specific Standards
- Interface, Control, and Monitor Multiple Devices:
 - Barriers
 - Gates
 - Drop Arms
 - Wrong Way Detection
 - Over Speed Detection
 - License Plate Readers
 - Audible and Visual Warning
 - Safety Devices
 - Card Access Systems
 - Power Line Conditioning
 - CCTV
 - Siren Sensing Operators
 - And More...
- Password Protection and Master Overrides
- Intuitive Interface Requiring Minimal Operator Training
- Designed for New or Existing Systems
- Remote Monitoring Capabilities
- UFC/UFGS/ASTM and SDDCTEA Capabilities
- Easily connect via Copper/CAT5 or Fiber Optic Cable Networks
